

Serial No. 09/805,200
Docket No. BUR919980050US2
(BUR.006 DIV1)

2

AMENDMENTS TO THE CLAIMS:

1. (Previously presented) A microprocessor, comprising:

a microcode unit for outputting control signals, for each of a plurality of instructions, required by said microprocessor for executing said instructions, the microcode unit comprising:

an instruction address input for receiving an instruction address;

a control variable input for receiving a control variable corresponding to a current state of the microprocessor;

a control signal input for receiving all the control signals output by the microcode unit for an immediately preceding instruction; and

a plurality of embedded logic circuits each dedicated for evaluating one unique type of instruction received by the microcode unit and for setting the control signals required for executing said received instruction.
2. (Original) The microprocessor according to claim 1, wherein each of the embedded logic circuits includes:

a table for performing a table lookup in response to a received instruction; and

a controller responsive to the control variable, the control signals for an immediately preceding instruction, and to the table lookup for controllably setting each of the control signals required by the microprocessor for executing said received instruction.
3. (Original) The microprocessor of claim 2, wherein the controller includes:

means for setting a control signal to a "1" regardless of its immediately preceding value;

Serial No. 09/805,200
Docket No. BUR919980050US2
(BUR.006 DIV1)

3

means for setting a control signal to a "0" regardless of its immediately preceding value;

and

means for not modifying a control signal from its immediately preceding value.

4. (Original) The microprocessor of claim 3, wherein the controller further includes:

means for setting a control signal to a data state.

5. (Canceled).

6. (Previously presented) The microprocessor according to claim 1, further comprising
means for determining which of the control signals are not to be modified for each instruction.

7-8. (Canceled).

9. (Previously presented) A microcode unit in a microprocessor, for outputting control
signals, for each of a plurality of instructions, required by said microprocessor for executing said
instructions, the microcode unit comprising:

an instruction address input for receiving an instruction address;

a control variable input for receiving a control variable corresponding to a current state of
the microprocessor;

a control signal input for receiving all the control signals output by the microcode unit for
an immediately preceding instruction; and

(BUR.006 DIV1)

4

a plurality of embedded logic circuits each dedicated for evaluating one unique type of instruction received by the microcode unit and for setting the control signals required for executing said received instruction.

10-19. (Canceled).

20. (Original) A method of providing a state machine decoding, comprising:
- decoding a current opcode to provide a decode;
 - setting required functions signals;
 - setting exclusive functions outside of the current opcode to a previous state; and
 - latching results of the decode.

21-22. (Canceled).

23. (Currently amended) The microprocessor of claim 1, wherein each of the plurality of embedded logic circuits comprises:

a controller for controllably setting each of the control signals required by the microprocessor for executing said received instruction.

24. (Previously presented) The microprocessor of claim 1, wherein each of the plurality of embedded logic circuits comprises a controller for controllably setting only each of the control signals required by the microprocessor for executing said received instruction.

Serial No. 09/805,200
Docket No. BUR919980050US2
(BUR.006 DIV1)

5

25. (Previously presented) The microprocessor of claim 1, wherein each of the plurality of embedded logic circuits comprises a table that performs a table lookup in response to a received instruction.

26. (Previously presented) The microprocessor of claim 25, wherein said controller is responsive to the control variable, the control signals for an immediately preceding instruction, and to the table lookup.

27. (Previously presented) The microprocessor of claim 23, wherein the controller includes means for maintaining a control signal at an immediately preceding value of said control signal.

28. (Previously presented) The microprocessor of claim 27, wherein the controller further includes:

means for setting a control signal to a "1" regardless of an immediately preceding value of said control signal; and

means for setting a control signal to a "0" regardless of an immediately preceding value of said control signal.

29. (Previously presented) The microprocessor of claim 28, wherein the controller further comprises means for setting a control signal to a data state.

Docket No. BUR919980050US2
(BUR.006 DIV1)

6

30. (Previously presented) The microprocessor according to claim 1, further comprising means for determining at least one of said control signals to be maintained for each instruction.
